End Milling Settings

PLC

I. The end milling axis, namely `1K1`, is a homed axis.

II. Required options are activated.

(PLC → GV_Definitons.exp *)*

- `C_OPTION_END_MILLING` (* End milling option in the machine *)
- `C_REVERSE_ENDMILLING` (* End milling blade reverse *)
- `C_ENDMILLING_BLADE_COMPRESS_SENSOR` (* End milling blade compression sensor option *)

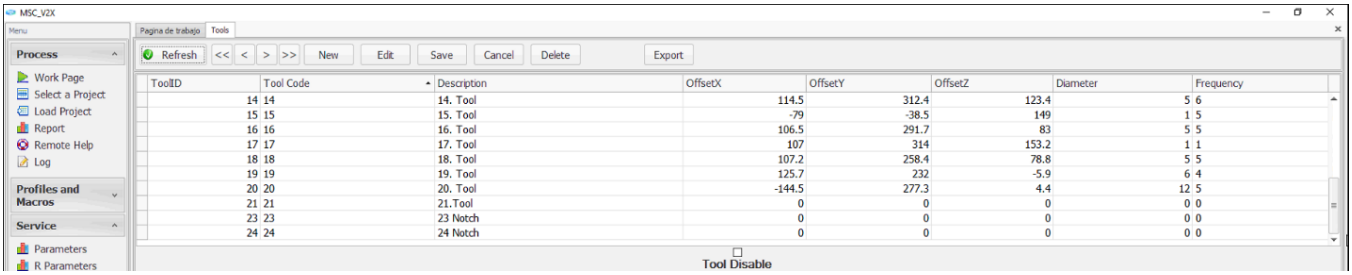

MSC

I. Required parameters for end milling positioning must be set.

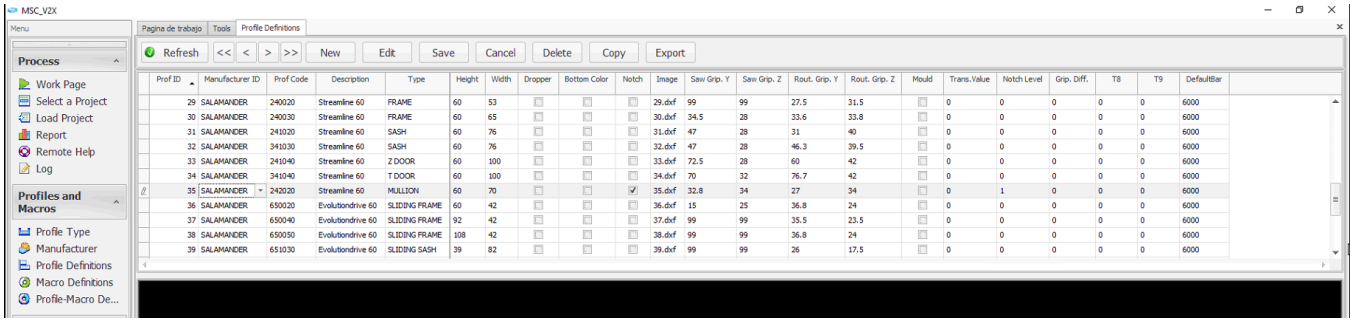

(Parameters → Cutting Station *)*

- `stKaliciData.PosLmtMin_1K1`
- `stKaliciData.PosLmtMax_1K1`
- *(* 1K1 limits are changed from persistent data, limits cannot be changed from TSM program. *)*
- *(* Max. limit position should be set so that the End Milling Forward Sensor will not detect it. *)*
- `stKaliciData.fKertmeOffset`
- *(* Offset value used for the profile to reach the end milling position *)*
- `stKaliciData.fKertmeCenterPosition`
- *(* Position where the end milling blade passes through the zero point of the table *)*
- `stKaliciData.fKertmeProfilGenislik`
- *(* Maximum width dimension of the profiles to be end milled *)*
- `stKaliciData.fKertmeBicakCap`
- *(* Diameter of the large blade in end milling *)*
- `stKaliciData.fKertmeTolerans`
- *(* Blade clearance value from the profile after end milling operation *)*
- `stKaliciData.fKertmeMaxVelocity`
- `stKaliciData.fKertmeMidVelocity`
- `stKaliciData.fKertmeSlowVelocity`

II. If `Tool23` and `Tool24` do not exist in the tool page, they are added to the database. *(* Master → DBMaster.mdb *)*

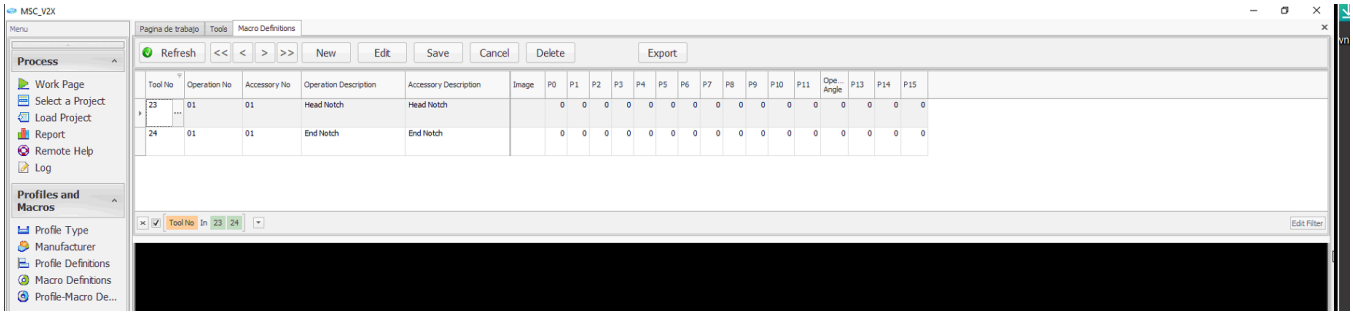

III. In profile definitions, the **end milling column** and **end milling step (0,1,2)** are selected for the desired profile.

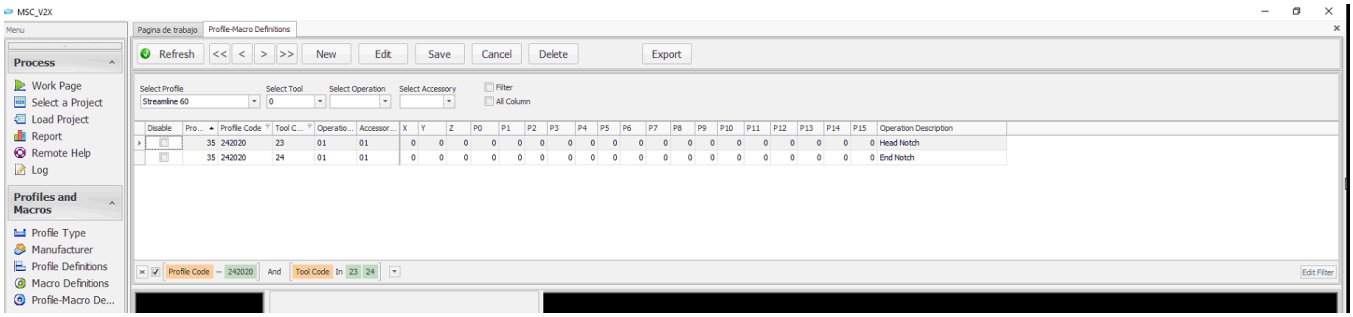

(Profiles and Macros → Profile Definitions *)*

IV. End milling macros are defined. Select `Tool23` for part start; select `Tool24` for part end.

(Profiles and Macros → Macro Definitions *)*

V. End milling macros to be processed are defined for the profile to be end milled.

(Profiles and Macros → Profile-Macro Definitions *)*

VI. In the work file, `H043` must be used for part start and `H044` for part end.
